                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | ye do size d) 1   | or sha                                  | pe of t                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**ELECTROSTATICS** 

41. If the potential difference across the two plates of a parallel capacitor is doubled, then energy

(a) Remains same (b) Two times (c) Four times

(d) Three times

42. One coulomb charge is carried by:

(a) 6.25 x10⁻¹⁸ electron (b) One electron (c) One proton

(d) 1.6 x10⁻¹⁹

43. The increase in the capacitance of a capacitor due to the presence of dielectric is due to: (a) Electric polarization of dielectric

(b) Density of dielectric

(c) Volume of dielectric

(d) Magnetic dipole moment

44. Find the electric field strength required to hold suspended a particle of mass 10⁻⁶ kg and charge 1.0µC between two plates 10.0 cm apart.

(a) 0.98 V/m

(b) 980 V/m

(c) 9.8 V/m

(d) 98 V/m

45. The ratio of forces between two small spheres with constant charge (a) in air (b) in a medium of dielectric constant K is:

(a) 1·K

(b) K:1

(c) 1:K2

(d) K²:1

46. Electric field lines due to a negative charge are:

(a) Always horizontal (c) Radially towards the charge (b) Always vertical

(d) Radially away from the charge

47. You have three capacitors, each of 3  $\mu$ C. In which of the following combinations of the three capacitors, the resultant capacitance is 9  $\mu$ C?

(a) All three capacitors in series

(b) Two capacitors are in series, one in parallel

(c) Two capacitors are in parallel, one in series

(d) All three capacitors in parallel

48. Coulomb per volt is called:

(a) Ampere

(c) Joule

(d) Farad

49. The unit of electric flux density is:

(a) N/C

(b) V/m

(b) Electron volt

(c) Nm

(d) A and B

50. A charge is moving with velocity v, if enters a uniform electric field  $\vec{E}$ . The direction of  $\vec{v}$  and  $\vec{E}$ are not parallel. What is the path of the charge particle inside the electric field?

(a) Parabolic (b) Circular

(c) Parallel to v

(d) Parallel to E

### PRACTICE TEST NO. 4

FLECTROSTATICS

Many computer keyboard buttons are constructed using capacitors. When a key is pushed down, Many computer has between the moveable plate and the fixed plated is compressed. When the key is the soft insulator between the moveable plate and the fixed plated is compressed. When the key is pressed what happens to the capacitance?

(a) It increases

It decreases

It remains same

It changes in a way you cannot determine because of the complex circuit

 $C_{eq} = C_1 + C_2 + C_3 + \dots C_n$  is the combination in

(c) Both of them

(d) None of them

The distance between two point charges if halved, the force between them would be:

(a) Half

(b) One fourth

(c) Double

(d) Four times

4. The unit of electric field strength is:

(b) N/V

(c) N/C

(d) N m

(a) V/C 5. The force between two charges Q and q, separated by a distance d is F. What will be the force

between them when distance between them is d/2? (b) 2F

(c) F

(d) F/2

(a) 4F 6. Electrostatic force is

(a) Nonconservative (c) Depends on shape of charge (b) Conservative

(d) None of these

7. Charged body attracts uncharged body by .... Induction

(a) Electrostatic (b) Magnetic

(c) Both A and B

(d) None of these

8. After how many time constants a capacitor is about completely discharged? (b) 5 (a) 1 (c) 3 (d) 2

9. Which of the following is the same as farad?

(a)  $\Omega$  s

(b)  $\Omega^{-1}$  s

(c) Ω s'

(d) Ω-1 s-1

10. When area of plates of capacitor is decreased, the capacitance will:

(a) Increase

(b) Constant

(c) Decrease

(d) Become infinite

(d) 6 x 10° C

11. A capacitor of 5 µF is connected with a battery of 12 V, the charge stored in capacitor: (a) 4 x 10⁻⁵ C (b) 6 x 10⁻⁵ C (c) 4 x 10⁻⁶ C

12. The capacitor which charges and discharges quickly will have? (a) Small value of RC

(b) Large value of time constant

(c) Large value of RC (d) Zero value of time constant 13. The area of plates of 1 pico farad capacitor separated by 8.85 mm placed in the air is:

(a) 1 mm²

(b) 10 mm²

(c) 100 mm²

14. A battery is permanently connected to a parallel plate capacitor and the energy stores is x joules. When one plate is moved so that separation of the plate is doubled, the energy now stored in joule

(a) 4 x

(b) x/2

(c) 2 x

(d) x/4

15. Two capacitors of capacitance 0.3  $\mu$ F and 0.6  $\mu$ F respectively are connected in series. The combination is connected across a potential of 6 V. The ratio of energy stored by capacitors is:

(b) 2

(d) 4

16. Capacitor stores energy in the form of: (a) Electric field Electromagnetic field

(b) Magnetic field

(d) Gravitational field

AT PREP BOOK

Zayan Publisher **ELECTROSTATICS** UNIT 06 17. The electric potential at a point of distance 1 m from 2  $\mu$ C charge is: (b)  $1.8 \times 10^4 \text{ V}$  (c)  $1.8 \times 10^8 \text{ V}$ (d) 1.8 x 10⁵ V (a)  $1.8 \times 10^6 \text{ V}$ 18. Charge is distributed uniformly on the surface of large flat plate. The electric field 2 cm from the plate is 20 N C1. What is the electric field at 4 cm from the plate? (d) 7.5 N C⁻¹ (b) 15 N C⁻¹ (c) 20 N C-1 (a) 120 N C⁻¹ 19. For an isolated positive charge, the zero-field spot lies: (b) At infinity (a) At 2 m from charge (d) At very small distance from charge (c) At 10 m form charge 20. By moving charge of 20 C by 2 cm, 2 J of work is done. The potential difference between the points: (a) 0.1 V (b) 8 V (c) 2 V (d) 0.5 V 21. Which of the following is correct? (a) Joule = coulomb / volt (b) Joule = volt / ampere (c) Joule = volt x ampere (d) Joule = coulomb x volt 22. The vector form of electric field intensity due to a negative charge is: (a)  $\vec{E} = -\frac{kq \, q_0}{r^2} \hat{r}$  (b)  $\vec{E} = \frac{kq \, q_0}{r^2} \hat{r}$  (c)  $\vec{E} = -\frac{kq}{r^2} \hat{r}$  (d)  $\vec{E} = -\frac{kq}{r^2} \hat{r}$ 23. The minimum charge on an object is: (a) 1 C (b)  $6.25 \times 10^{18}$  C (c) 1.6 x10⁻¹⁰ C (d) 1.6 x 10⁻¹⁹ ( 24. The magnitude of  $\frac{1}{4\pi\epsilon_0}$  is: (c)  $8.85 \times 10^{-12}$  (d)  $8.85 \times 10^{12}$ (a)  $9 \times 10^9$ (b) 9 x 10⁻⁹ 25. Three capacitors each of 6μF are available. The minimum and maximum capacitors which be obtained are: (b)  $3\mu F$ ,  $12\mu F$ (c)  $2\mu F$ ,  $12\mu F$ (a) 6µF, 18µF (d) 2µF, 18µF 26. Two capacitors connected in parallel having the capacities C1 and C2 are given 'q' charge, w is distributed among them. The ratio of charges is: (a)  $\frac{c_1}{c_2}$  (b)  $\frac{1}{c_1c_2}$  (c)  $\frac{c_2}{c_1}$  (d)  $C_1C_2$ 27. If there are n capacitors in parallel connected to V volt source, then the energy stored is equal to  $C_1C_2$ (b) CV² (c)  $\frac{1}{2}$ nCV² (d)  $\frac{1}{2\pi}$ CV² 28. A capacitor of capacity 50μF is charged to 10 V, its energy is equal to: (a)  $2.5 \times 10^{-3} \text{ J}$  (b)  $2.5 \times 10^{4} \text{ J}$  (c)  $5 \times 10^{-2} \text{ J}$  (d)  $1.2 \times 10^{8} \text{ J}$ 29. A drop of 10-6 kg water carries 10-6 C charge. What electric field should be applied to balance weight the sale and an asset of the sale and (b) 10 Vm⁻¹ downward (a) 10 Vm upward (c) 0.1 Vm⁻¹ upward (d) 0.1 Vm⁻¹ downward

UNIT 06

Zayan Publ.

33. Two plates are 2 cm apart, a potential difference of 10 V is applied between them, the electric field between the plates is:

(b) 500 NC⁻¹ Zayan Publishe (a) 20 NC (d) 250 NC (d) 250 NC (d) 250 NC (e) 34. An electron is moving around the nucleus of a hydrogen atom in a circular orbit of radius r. The coulomb force  $\vec{F}$  between the two is: (a)  $-K\frac{e^2}{r^3}\hat{r}$ (a)  $-K_{r^3}$  (d)  $-K_{r^2}^2\hat{\tau}$ 35. In the circuit diagram shown in the adjoining figure, the resultant capacitance between P and Q 2 uF = 20uF (b) 3 µF (c) 60 µF 36. The capacity of a condenser is  $4 \times 10^{-6}$  farad and its potential is 100 volts. The energy released on discharging it fully will be: (b) 0.04 J (c) 0.025 J (a) 0.02 J 37. An electron enters in an electric field with its velocity in the direction of the electric lines of force. Then, (a) Path of electron will be a circle (b) Path of electron will be a parabola (c) Velocity of electron will decrease (d) Velocity of electron will increase 38. Two unlike charges of magnitude q are separated by a distance 2d. The potential at a point midway between them is: (b)  $\frac{1}{4\pi\varepsilon_0}$  (c)  $\frac{1}{4\pi\varepsilon_0}\frac{q}{d}$  (d)  $\frac{1}{4\pi\varepsilon_0}\frac{2q}{d}$ (a) Zero 39. Two charge +q and -q are situated at a certain distance. At the point exactly midway between (b) Electric field is zero but potential is not (a) Electric field and potential both are zero (c) Electric field is not zero but potential is (d) Neither electric field nor potential is zero 40. Two charged sphere of radii 10 cm and 15 cm are connected by a thin wire. No current will flow, if they have: (a) Same charge on each (b) Same potential (c) Same energy (d) Same field on their surfaces 41. Two electrons are separated by a distance of 1Å. What is the coulomb force between them: (a)  $2.3 \times 10^{-8} \text{ N}$ (b) 4.6 x 10⁻⁸ N (c)  $1.5 \times 10^{-8} \text{ N}$ (d) None of these 42. Two charges each of 1 coulomb are at a distance 1 km apart, the force between them is: (a) 9x10³ Newton (c) 1.1x10⁴ Newton (d) 10⁴ Newton (b) 9x10⁻³ Newton 43. There are two charges +1 micro coulombs and +5 micro coulombs. The ratio of the forces acting on them will be: (a) 1:5 (d) 1:25 (b) 1:1 (c) 5:1 35. 36. 37. AT PREP BOOK

## PRACTICE TEST NO. 5

One plate of parallel plate capacitor is smaller than other, then charge on smaller will be:

(b) More than other

(a) Less than other

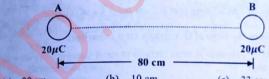

(d) Will depend upon medium between them

- (c) Equal to other 2. Charge on  $\alpha$  - particle is:
  - (a) 4.8x10⁻¹⁹ C
- (b) 3.2 x10⁻¹⁹C
- (c) 1.6x10⁻¹⁹ C
- (d) 6.4x10⁻¹⁹C

If a unit positive charge is taken from one point to another over an equipotential surface, the: (a) Work is done on the charge (b) Work is done by the charge

- (d) Work done is zero
- (c) Work done is constant 4. The unit of intensity of electric field is:
- (c) Vm
- (d) Nm⁻¹
- (a) NC⁻¹ (b) JC⁻¹

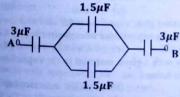

- (a) 20 cm
- (b) 10 cm
- (c) 33 cm
- (d) 40 cm
- 6. The energy stored in condenser of capacity C which has been raised to a potential V is given by:
  - (a) CV
- (b)  $\frac{1}{2}CV^2$
- (c) CV
- 7. A parallel plate capacitor is first charged then a dielectric slab is introduced between the plates. The quantity that remains unchanged:
  - (a) Charge
- (b) Potential
- (c) Capacitance
- (d) Energy
- 8. If a dielectric substance is introduced between the plates of a charged air-gap capacitor, The energy of capacitor will: (a) Increase

  - (c) Remain unchanged

- (b) Decrease
- (d) First increase than decrease
- 9. Two capacitors each of capacity  $2\mu F$  are connected in parallel. This system is connected in series with a third capacitor of 12  $\mu$ F capacity. The equivalent capacity of the system will be:
- (b) 13*u*F
- (d) 3µF
- 10. The capacitance between points A and B in the given circuit will be:

- (a) 1μF
- (b) 2µF
- (c) 3µF
- (d) 4µF

| Sr. 1                      |    |    |    |    |    |    |     |

AT PREP BOOF

11. Electric lines of force around a negative point charge are:

- (a) Circular, anticlockwise
- (b) Radial, inwards

(c) Circular clockwise

- (d) Radial, outwards
- (c) Circular, clockwise 12. Electric field at a distance of 10 cm from an isolated point particle with a charge of  $2 \times 10^{-9}$  C is: (b) 18 N C⁻¹ (a) 1.8 N C-1
  - (c) 180 N C⁻¹ (d) 1800 N C⁻¹
- 13. Which physical quantity would result from a calculation in which a potential difference is multiplied by an electric charge:
  - (a) Electric current

(b) Electric power

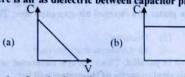

(c) Electric field strength

- (d) Electric energy
- 14. Two charges are placed at a certain distance apart in vacuum. If a glass slab is placed between them. The force between them:
  - (a) Will increase

- (b) Will remain unchanged
- (c) Will decrease
- (d) Will become infinity
- 15. When 1012 electrons are received from a neutral metal sphere. The charge on the sphere becomes:
  - (a) 0.16 µC
- (b) 0.32 μC
- (c)  $-0.1 \mu C$
- (d) -0.32 uC
- 16. What is electric potential energy of 7 nC charge that is 2 cm from a 2 nC charge:
  - (a) 6.3 x 10⁻⁶ J
- (b) 2.3 x 10⁻⁶ J
- (c) 4.3 x 10⁻⁶ J
- (d) 6.3 x 10⁻⁷ J
- 17. Which of the following provides us the slope of Q-V graph for a capacitor:

- (a) Capacitance
- (b) Energy
- (c) Energy density
- (d) Pressure
- 18. In the relation Q=CV, which graph correctly describes the relation between "C" and "V" when there is air as dielectric between capacitor plates:

- (c)
- (d)
- 19. If mica sheet is placed between the plates of capacitor, the capacity will:

(a) Increase

- (b) Remain same
- (c) Decrease
- Become zero (d)

- 20. Ohm x farad is equivalent to: (a) Second
- (c) Weber
- (d) Tesla
- (b) Henry 21. The distance between the plates of a parallel plate capacitor is 4.0 mm and area of each plate is 8m2. The plates are in a vacuum. What is the capacitance of capacitor?
  - (a)  $1.7 \times 10^{-8} \text{ F}$
- (b) 8.85 x 10° F
- (c) 3.4 x 10⁻⁹ F
- (d) 9.0 x 10⁻⁹ F
- 22. The ratio of the capacitance of capacitor with a given material to the capacitance of the same capacitor when the medium is vacuum is termed as:
  - (a) Permittivity of free space

(b) Specific inductive capacity

(c) Dielectric constant

(d) Energy stored

| Sr.  | 11. | 12. | 13. | 14. | 15. | 16. | 17. | 18. | 19. | 20. | 21. 22. |

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

23. Capacity of a capacitor depend upon?

(a) Size of plates

(a) E=F/q

- (d) All of these
- (b) Nature of dielectric between the plates
- (c) Distance between the plates (c) Distance better the place of instantaneous charge and maximum charge on plates of capacitor at t=RC is (during the place).
- discharging of capacitor):
  - (b) 99.3 %
- (c) 63 %

(c) E=F/3a

(d) 3.25 %

(d) 8 kV

(d) Coulomb / meter

(d) None of these

(d) Volt

- 25. Formula for electric field intensity is
  - (b) E=3F/2q

(d) None of them

- 26. The electron volt is the unit of (a) Electric current (b) Electric potential (c) Electric energy (d) (a) Electric flux Q at a potential difference  $\Delta V$ . What happens if the voltage applied to Q and Q are the a battery is doubled to Q  $\Delta V$ ?
  - the capacitor by a battery is doubled to  $2 \Delta V$ ?
  - (a) The capacitance falls to half its initial value, and the charge remains the same

**ELECTROSTATICS** 

- The capacitance and the charge both fall to half their initial values
- (c) The capacitance and the charge both double
- (d) The capacitance remains the same, and the charge doubles
- (d) The capacitor is 24 J. What is the potential difference between 28. The energy stored in a parallel plate capacitor is 24 J. What is the potential difference between
- the plates if the capacitance of the capacitor is 3  $\mu$ F?
- (b) 54 kV (a) 4 KV (c) 16 kV 29. The ratio gravitational force to electric force is always:

  - (a) Greater than unity
- (b) Less than unity (d) Zero
- (c) Equal to unity 30. Electric potential difference between the two points can be defined as:...
  - (a) Difference of the kinetic energy per unit charge
  - (b) Difference of the kinetic energy
  - (c) Difference of the potential energy per unit charge
  - (d) Difference of the potential energy
- 31 The SI unit of electric intensity is:
  - (a) Volt / meter (b) Newton / meter
- 32. The SI Unit of electric charge is:
- (a) Coulomb (b) Ampere
- 33. E=F/q is the formula for?
  - (a) Electrical field strength (c) Both of them
- (b) Electrical field intensity None of them

(c) Tesla

(c) Hertz

- 34. The charge on electron is equal to
  - (a) Proton (b) Two protons (c) Two neurons
- 35. The capacitance of a capacitor is a measure of its ability to: (a) Store charge (b) Store electric field
  - (c) Gain potential difference
- 36. Electric field at a point varies as  $r^0$  for:
- (a) A plane infinite sheet of charge
- (c) Electric dipole
- 37. Coulomb's law is only applicable for:
- (b) A point charge
- (d) Line charge of infinite length

(d) Store magnetic field

- (a) Big charges
- 38. Electric intensity at the centre of uniformly distributed charged sphere is:
  - (c) a/2
- (d) Any charges (d) q/ε₀
- 39. The value for er for air is: (b) Ka/r2

| r. 23           | 24  |     |     | (b) | 1.06 |     |     | (c  | ) 1. | 006 |     |     | (d) | 1.00 | 06  | -   |

AT PREP BOOK

40. Force acting on a positive charge is always:

- (a) In the direction opposite to electric field
- (b) In the direction of electric field
- (c) In the direction of perpendicular to electric field
- (d) In the direction perpendicular to the velocity of charges

41. A particle carrying a charge 3e, accelerates through a potential difference of 2V. The energy acquired by it is:

- (a) 6eV
- (b) 1.5eV
- (c) 0.66eV
- (d) 12eV

42. Electric potential difference can be defined as:

- (a)  $\Delta V = \Delta U q$
- (b)  $\Delta V = \Delta U/a$
- (c)  $\Delta V = \Delta U + a$
- (d)  $\Delta V = \Delta U *_0$

43. A proton has mass m and charge q. It is suspended in electric and gravitational field. What is the magnitude of electric field?

- (a) E = mg/q
- (b) E = mg/qv
- (c) E = mg/qvB
- (d) E = q/mg

44. A charge of 2 C placed in electric field of 10 N/C what will be the work done in moving charge a distance of 5 m:

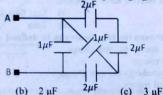

- (a) 100 J
- (b) 50 J
- (c) 150 J

45. Two charges of equal magnitude and at a distance r exerts a force F on each other. If the charges are halved and distance between them is doubled, then the new force acting on each charge is: (a) F/8

(b) F/4

(c) 4 F

46. The total capacity of capacitors shown in the adjoining figure between the points A and B is:

(a) 1 uF

- 2.0 m². The plates are in a vacuum. A potential difference of 1.0 x 10⁴ V is applied across the plates. Find the capacitance. (b) 3.54 x 10⁻⁹ F

  - (c)  $-8.85 \times 10^{-9} \text{ F}$
- (d) 9.0 x 10⁻⁹ F

(d) 4 µF

48. If the length, width and separation between the plates of a parallel plate capacitor is doubled then its capacitance becomes:

47. The distance between the plates of a parallel plate capacitor is 2.0 mm and area of each plate is

(a) Double

(a)  $4 \times 10^{-3} F$ 

- (b) Half
- (c) Four-times
- (d) Eight-times

49. The formula for electric field strength is 'E=F/Q', where E is electric field strength and F is force and Q is charge. Which one of the following options gives the correct base units for electric field strength?

- (a) kgms⁻²A⁻¹
- (b) kgs⁻²A⁻³
- (c)  $kg^2m^{-2}s^{-3}A$

50. For a heat engine 'A' ratio of Q2 to Q1 is 2/3 while that of heat engine 'B', ratio of Q2 to Q1 is 1/3. What is the value  $\eta_A : \eta_B$ ?

- (a) 1:3 (b) 2:3 (c) 1:2 (d) 2:1

|      | A Charles | ELF 931 |     |     |     |     |     |     |     | -   |     |

UNIT 07 >>

# **CURRENT ELECTRICITY**

## PRACTICE TEST NO. 1

1. Two unequal resistances are connected in parallel across a battery. Which of the following statement is true?

CURRENT ELECTRICITY

- (a) Same current will flow through both resistance
- (b) Current through smaller resistance is higher
- Current through larger resistance is higher (c)
- (d) Current can be higher in any resistance depending on emf of the cell

2. Three resistors of 2,3 and  $5\Omega$  are connected in the form of a triangle. If a battery of 2.5 V is connected across  $5\Omega$  resistor, then the current passing through  $3\Omega$  will be:

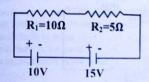

(b) 0.25 A

(c) 0.5 A

(d) 0.75 A

(a) 1A 3. A 50 V battery is connected across a 10 ohm resistor. The current is 4.5 amperes. The internal resistance of the battery is:

- (a) Zero
- (b) 0.5 ohm
- (c) 1.1 ohm
- (d) 5 ohm
- 4 In the diagram shown, the current through the resistor will be:

(a) = A clockwise

(b)  $\frac{3}{2}A$  clockwise

(c)  $\frac{1}{2}A$  anticlockwise (d)  $\frac{5}{2}A$  anticlockwise

5. Two wires of same material have length L and 2L and cross-sectional areas 4A and A respectively. The ratio of their specific resistance would be:

(a) 1:2

(b) 8:1

(d) 1:1

6. An electric bulb of 100 watt is connected to a supply of electricity of 220V. Resistance of the

(a) 484 Ω (b) 100 Ω

(c) 22000 Ω

7.  $62.5 \times 10^{18}$  electrons per second are flowing through a wire of area of cross-section  $0.1 \text{ m}^2$ , the value of current flowing will be: (a) 1A

(b) 0.1 A

8. You are given three bulbs of 25, 40 and 60 watt. Which of them has lowest resistance:

(d) 0.11 A (d) Insufficient info

(a) 25 watt bulb (b) 40 watt bulb 9. The resistance of a conductor is 5 ohm at 50°C and 6 Ohm at 100°C, the resistance at 0°C is:

10. A current of 1 mA is flowing through a copper wire. How many electrons will pass a given point

(a)  $6.25 \times 10^{19}$ 

(b)  $6.25 \times 10^{15}$ 

(c)  $6.25 \times 10^{31}$ 

(d) 6.25 x 10⁸

PREP BOOK By AZHAR IOBAL 0336-7098894 331

11. The example for non-ohmic resistance is:

(a) Copper wire

(b) Filament bulb

(c) Diode (d) Both b and c

12. An expression for rate of heat generated, if a current of I ampere flow through the bulb is:

(b) 1²R

(c)  $V^2R$ 

(a) I²Rt 13.  $\sigma_1$  and  $\sigma_2$  are electrical conductivities of Ge and Na respectively. If these substances are heated

(a) Both  $\sigma_1$  and  $\sigma_2$  increase

(b)  $\sigma_1$  increases and  $\sigma_2$  decreases

(c)  $\sigma_1$  decreases and  $\sigma_2$  increases

(d) Both  $\sigma_1$  and  $\sigma_2$  decreases

14. Five cells, each of emf E and internal resistance 'r', are connected in series. If by mistake one the cells is connected wrongly, the equivalent emf and internal resistance of the combination are?

(a) 5E, 5r

(b) 3E, 3r

(c) 5E, 3r

15. Four identical cells each having an emf of 12V, are connected in parallel. The electromotive force of the combination is:

(a) 48 V

(b) 12V

(c) 4V

16. A student has 10 resistors of resistance 'r'. The minimum resistance made by him from given resistors is:

(a) 10 r

17. 20µA current flows for 30 s in a wire, transfer of charge will be:

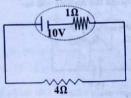

(a) 2 x 10⁴ C

(b)  $4 \times 10^{4} \text{ C}$ 

(c) 6 x 10⁻⁴ C

(d) 8 x 10⁻⁴ C

18. In the circuit shown, the rate of energy dissipation in the battery is:

(a) 2W

(b) 6 W

(c) 4W

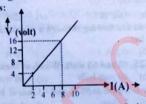

19. The resistance of hot tungsten filament is about 10 times more than the resistance of cold tungsten filament. What will be the resistance of 100 W and 200 V lamp when hot in use?

(a) 40 Ω

(b) 400 Ω

(c) 200 Ω

20. Variation of current and voltage in a conductor has been shown in the diagram below, The resistance of the conductor is:

(a) 4 ohm

(b) 2 ohm

3 ohm

(d) 1 ohm

21. The current in a resistor is 12.0 mA. What charge flows through the resistor in 0.020 s?

(b) 2.4 Mc

(c) 0.24 mC

(d) 0.40 mC

(a) 0.16 mC at 80°C is  $(\alpha = 0.004041^{\circ}C^{\circ})$ :

| 22. A cop<br>(a) | ) 264. |     |     |     | 5.45Ω | its resis |     | .64.65Ω |     | (d) | 325.45 kH    |

UNIT 07

23. A steady current flow in metallic conductor of non-uniform cross-section. The quantity / A steady current along the length of the conductor is /are; quantities constant along the length of the conductor is /are;

(a) Drift velocity only

(b) Current and drift speed

**CURRENT ELECTRICITY** 

(d) Current only

(c) Current, drift velocity and drift speed (c) Current, drift votes  $1 \times 10^{-7}\Omega$ . The resistance of an iron wire of particular length and 14. The resistivity of iron is  $1 \times 10^{-7}\Omega$ . If both the length and the diameter of wire are doubled the The resistivity of Iron the length and the diameter of wire are doubled, then the resistivity in  $\Omega$ 

m will be:

(b) 2 x 10⁻⁷

(c) 4 x 10

(a) 1 x 10⁻⁷ (a)  $1 \times 10^{-7}$  (d)  $8 \times 10^{-7}$  25. A potential difference V is applied to a conductor of length  $\ell$  and radius r. When potential

difference is doubled, the drift velocity is: (b) Unchanged

(a) Halved

(c) Doubled

(d) Quadrupled

26. Read the following statements: Y: The resistivity of a semiconductor decrease with increase of temperature

Y: The resistance of collisions between free electrons and ions increase with increase of temperature.

Select the correct statement(s) from the following:

(a) Y is true but Z is false

(b) Both Y and Z are true

(c) Y is false but Z is true

(d) Y is true and Z is the correct reason for Y.

27. Terminal potential difference and electromotive force:

(a) Have same units

(b) Always have same values

(c) Have different units

(d) Always have different values

28. The four bulbs of 60 W each are connected in series and a battery is connected across their combination. Which of the following statement is true?

(a) Current through each bulb is same

Voltage across each bulb is not same

(c) Power dissipation in each bulb is not same

(d) All of these

29. A unit of electricity is usually equal to:

(a) One kilowatt

(b) One watt minute

(c) One kilowatt hour

(d) One joule hour

30. A battery of four cells in series, each having an emf of 1.4 V and an internal resistance of  $2\Omega$ , is to be used to charge a small 2 V accumulator of negligible internal resistance. The charging current

(a) 0.1 A

(b) 0.2 A

(c) 0.3 A

(d) 0.45 A

31. You have three appliances, each of 500 W, running on 220 V a.c: (i) an electric lamp, (ii) an electric iron (iii) an electric room heater. The electrical resistance is: (a) Maximum for electric lamp

(c) Maximum for the heater

(b) Maximum for electric iron (d) Same for all

32. In the short circuit, current is (a) Zero, infinite

and in the open circuit, resistance is

33. Which statement describes the electrical potential difference between two points in a wire (c) Infinite, infinite (d) Infinite, zero

(a) The force required to move a unit positive charge between the points

The ratio of the energy dissipated between the points to the current The ratio of the power dissipated between the points to the current

The ratio of the power dissipated between the points to the charge moved

wire will be:

(b)

19.

20.

36. Two bulbs one of 50 watt and another of 25 watt are connected in series the mains. The ratio of the currents through them is:

(a) 2:1

(b) 1:2

(c) 1:1

Without voltage (d) cannot be calculated

37. For which of the following the resistance decreases on increasing the temperature:

(a) Copper

(b) Tungsten

(c) Germanium

(d) Aluminum 38. A certain wire has a resistance R. The resistance of another wire identical with the first except having twice its diameter is:

(a) 2 R

(b) 0.25 R

(c) 4 R

(d) 0.5 R

39. The resistance of a wire is 20 ohm. It is so stretched that the length becomes three times, then the new resistance of the wire will be:

(a) 6.67 ohm

(b) 60 ohm

(c) 120 ohm

(d) 180 ohm

40. Three resistors each of 2 ohm are connected together in a triangular shape. The resistance between any two vertices will be:

(a) <del>4</del>ohm

(b)  $\frac{3}{2}$ ohm

(c) 3 ohm

41. A battery of 10 V and internal resistance 0.5Ω is connected across a variable resistor R. The value of R for which power delivered is maximum equal to:

(b) 1.0 Ω

(c) 0.5 Q

42. The emf of a cell is 1.5 V. When it is short circuited, the current of 6A flows. The internal resistance of cell is:

(a) 0.25 Ω

(b) 0.75 Ω

(c) 0.50 Ω

(d) 1.0 Ω

43. The emf of a battery is 2 V and its internal resistance is 0.5 Ω. The maximum power which it can deliver to any external circuit will be:

(a) 8 watt

(b) 4 watt

(c) 2 watt

(d) 1 watt (d) 0.40 mC

44. The current in a resistor is 8.0 mA. What charge flows through the resistor in 0.020 s? (b) 4.0 mC

(a) 0.16 mC

45. Which equation represents the maximum output power (b)  $P = I^2 R$ 

(c) 1.6 mC (c)  $P = V^2/R$ 

(d) All of these

46. The current passing through a conductor is directly proportional to the potential difference applied across its terminals, provided the temperature and other physical conditions of the conductor does not change:

(a) Gauss's law

(a) P = VI

(b) Lenz law

(c) Pascal's law

(d) Ohm's law

47. Electric power is:

(a) Rate of electric work done per unit time

(b) Voltage per unit time

(c) Electric charge per unit time

(d) Current per unit time

48. A 250V bulb passes a current of 0.3A. Calculate the power in the lamp.

(a) 50W (b) 75W (c) 100 W

(d) 990W

49. The length of a conductor is halved, its resistance will be:

(a) Halved

(c) Unchanged

(d) Quadrupled

(b) Doubled 50. A wire of uniform area of cross-section A and length L is cut into two equal parts, the resistivity of each part is

(a) Doubled

(c) Remains the same

(b) Half

(d) Increase three times

## PRACTICE TEST NO. 3

CURRENT ELECTRICITY

In the following circuit, the resistance between points X and Y is:  $10\Omega$ 10Ω  $20\Omega$  $10\Omega$ 

(b) 100 Ω

(c) 15 Ω

(d) 5.1Ω

2.  $1 \times 10^7$  electrons pass through a conductor in 1 $\mu$ s. The current in (mA) through the conductor is: (b)  $1.6 \times 10^{-3}$ (c) 1.6x10⁻⁴

(a) 1.6x10⁻⁶

(d) 1.6x10-5

3. The internal resistance of a cell can be expressed:

(d) E - 1

4. The terminal potential difference of a cell of emf E when short circuit is:

(a) E

(c) Zero

5. The quantity of charge required to provide a current of 10A for 1 hour is:

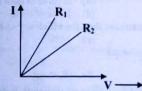

(a) 3600 C

(b) 360 C

(c) 36000 C

(d) 360000 C

6. I-V graph for two different resistors is shown in the figure below then:

(a)  $R_1 > R_2$ 

(b)  $R_1 < R_2$ 

(c)  $R_1 = R_2$ 

(d)  $R_1 = 2R_2$ 

7. When the length and area of cross-section both are doubled, then its resistance:

(a) Will become half

(c) Will remains same

(b) Will be doubled

(d) Will become four times 8. A wire 100 cm long and 2 mm diameter has a resistance of 0.7 ohm, the electrical resistivity of the material is:

(a) 4.4 x 10⁻⁶ ohm x m (c) 1.1 x 10⁻⁶ ohm x m (b)  $2.2 \times 10^{-6}$  ohm x m

(d) 0.11 A 9. Two wires with resistance R and 2R are connected in parallel, the ratio of heat generated in 2R

(a) 1:2

(b) 2:1

10. Two bulb are working in parallel order. Bulb A is brighter than bulb B. If  $R_A$  and  $R_B$  are their

resistance respectively then: (a)  $R_A > R_B$ 11. The value of internal resistance of an ideal cell is:

(d) None of these

12. If a high power heater is connected to electric mains, then the bulb in the house become dim,

| (a) Current drop | (b) Po | tential d | rop | (c) N | lo curren | t drop | (d) | No pote | ntial dro |
|------------------|--------|-----------|-----|-------|-----------|--------|-----|---------|-----------|

(b) 4.0 Ω

(c) 2.0 Ω

23. A piece of wire of resistance 4Ω is bent through 180° at its mid-point and the two halves are

twisted together. Then the resistance is: (c) 20 (a) 8Ω

24. The electric resistance of a certain wire of iron is R. If its length and radius are both doubled,

(a) The resistance will be halved and the specific resistance will remain unchanged

(b) The resistance will be halved and the specific resistance will be doubled

(c) The resistance and the specific resistance will both remain unchanged

(d) The resistance will be doubled and the specific resistance will be halved

25. A wire has resistance 16Ω. It is bent in the form of a circle. The effective resistance between the two points on any diameter of the circle is:

(a) 4Ω

(b) 32Ω

(c) 10Ω

(d) 24Ω

24. 25. 19. 20. 21. 22. 23. 15. 16. 17. 18. Ans: By AZHAR IQBAL 0336-7098894

**CURRENT ELECTRICITY** UNIT 07 26. Two resistors of 15 $\Omega$  and 30 $\Omega$  are connected in parallel. What should be the value of R to be connected in series with the other two so that the net resistance will be  $20\Omega$ ? (d) 120Ω (c) 15Ω (b) 10Ω (a) 5Ω 27. In SI unit, J C' equal to: (d) Joule (c) Newton (b) Pascal (a) Volt 28. A 50 W bulb is connected in series with a room heater. If now 50 W bulb is replaced by 100 W hulb. The heater output will: (d) Heater will burn out (a) Increase (c) Decrease (b) Remain same 29. If the power company sells electrical energy at Pkr 18/kWh, how much does it cost to run 100 W power for 3 hours: (d) Pkr 2.5 (a) Pkr 5.4 (b) Pkr 8.8 (c) Pkr 6.7 30. A 2 kW boiler used for 1 h energy per day consumes the following electrical energy in 30 days: (d) 80 units (a) 60 units (b) 120 units (c) 15 units 31. The effective wattage of 100 W, 60 W and 40 W lamps connected in series, is equal to: (a) 200 W (d) 19.3 W (b) 124 W (c) 47.8 W 32. A battery has an emf of 24 V and an internal resistance of 2.5 Ω. When an external 5.5Ω resistor is connected across the terminals of the battery, the potential difference between the terminals (a) 12.5 V (b) 13.5 V (c) 18.5 V (d) 16.5 V 33. A total charge of 100 C flows through a 12 watt bulb in a time of 50 second. What is the potential difference across the bulb during this time? (a) 0.12 V (b) 6.0 V (d) 24 V (c) 2.0 V 34. Two bulbs one of 35 W, 220 V and other of 70 W, 220 V are connected in parallel across the mains of 220 V. The current: (a) In 35 W bulb is lesser (b) Is same in both bulbs (c) In 70 W bulb is lesser (d) None of these 35. Which of the following expression is true? (a) 1 watt =  $(1 \text{ ohm}) \times (1 \text{ ampere})$ (b) 1 watt = (1 volt) x (1 ampere) (c)  $1 \text{ watt} = (1 \text{ ohm}) \times (1 \text{ volt})$ (d) 1 watt =  $(1 \text{ ampere}) \times (1 \text{ ohm})^2$ 36. The amount of energy obtained by a source with power of 1 kilowatt in one hour is equal to one: (a) Kilowatt hour (b) Electron volt (d) Calorie (c) Joule 37. Find the resistance of voltage of the circuit is 45 volts and current 30 Amp? (a) 1.6 ohm (b) 1.5 ohm (c) 1.7 ohm (d) 1.8 ohm 38. Which of the following can have negative temperature coefficient? (a) Compounds of silver (b) Liquid metals (c) Metallic alloys 39. Four wires of same material, the same cross-sectional area and the same length when connected in parallel give a resistance of 0.25 ohms. If the same four wires are connected is series the effective resistance will be (c) 3 ohm (d) 4 ohm

(a) 1 ohm (b) 2 ohm 40. Volts / Ampere =

(d) None of these

(a) Ohm (b) Pascal (c) Ohm meter 41. A 200 W bulb operates in a 220V circuit. Find the current.

(c) 0.6 Amp

(d) 3 Amp

(b) 2 Amp 42. If I, R and t are the current, resistance and time respectively, then according to Joule's law heat produced will be proportional to (a) I²Rt (b) 12Rf

43. SI unit of resistivity is

(a) 0.9 Amp

(c) I2R2t

(d)  $I^2R^2t^2$ 

(a) Ohm (b) Ohm meter (c) Ohm/meter (d) Meter/ohm Sr. 26, 27, 28, 29, 30. 31. 32. 33. 34. 35. d d

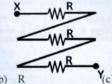

44. The resistance of a superconductor is:

(a) Finite

(b) Infinite

(d) Changes with every conductor (c) Zero

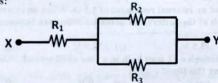

45. Three resistors each having value 'R' are connected as shown in figure. What is the equivalence resistance between 'X' and 'Y'?

(a) 3R

R/3

46. Three resistors of resistance R1, R2 and R3 are connected as shown in figure. Equivalence resistance is:

(a)  $R_1+R_2+R_3$ 

(c)  $R_1R_2+R_2R_3+R_2R_3$ 

47. The length and radius of an electric resistance of a certain wire are doubled simultaneously, then the:

Resistance will be doubled and specific resistance will be halved

Resistance will be halved and specific resistance will remain unchanged

Resistance will be halved and the specific resistance will be doubled (c)

(d) Resistance and specific resistance will both remain uncharged

48. Resistivity of a wire is ohm-m if 0.75 A current flows through it by applying 1.5 V potential difference, take length and cross section as 5m and  $2.5 \times 10^{-7}$  m²:

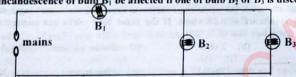

(a)  $1 \times 10^{-7}$ 

(b)  $2.63 \times 10^{-8}$ 

(c)  $19 \times 10^{-8}$ 

(d)  $7.85 \times 10^{-8}$ 

50. Three bulbs B1, B2 and B3 are connected to the mains as shown in the figure given below. How will the incandescence of bulb B1 be affected if one of bulb B2 or B3 is disconnected from the circuit?

(a) no change in incandescence

(b) Bulb B1 will become brighter

(c) Bulb B1 will become less bright

(d) Bulb B2 will become less bright

50. The resistance of a conductor at absolute zero (0 K) is:

(a) Almost zero

Almost infinite

(c) No prediction at all

(d) May increase or decrease

### PRACTICE TEST NO. 4

1. Resistivity of a substance is defined as the resistance of a .... of that substance:

(a) Meter (b) Meter square (c) Meter cube

2. Value of current in a short circuit is (a) Infinite

(b) Zero

(c) Minimum

(d) Centimeter (d) Maximum

3. Resistivity of a wire is ohm-m if 0.75 A current flows through it by applying 1.5 V potential difference, take length and cross section as 5m and  $2.5 \times 10^{-7} m^2$ .

(a)  $1 \times 10^{-7}$ 

(b)  $2.63 \times 10^{-8}$ 

(c) 19 × 10-8

4. In a conductor, if 6-coulomb charge flows for 2 seconds. The value of electric current will be

(a) 3 amp

UNIT 07

(c) 3 volts

(b) 2 amp (d) 2 volts

5. In series circuit, current remains

(a) Same

(c) Sometime same sometimes different

(b) Different (d) None of them

(c) Nichrome

6. Which of the following has a negative temperature coefficient of resistance? (b) Carbon

(a) Tungsten 7. Correct form of ohm's law

(b) 1 ∝ V

(c) V = IR

(d) Platinum (d) Both B & C

(a) I = VR8. The SI unit for resistance is?

(a) Ohm

(b) Ampere

(c) Watt (d) Volts 9. If the load resistance is less or greater than the source resistance, then power delivered to the load will be:

(a) Zero

Less than maximum

Maximum

(d) infinite

10. A class has ten 25 W compact fluorescent lamps. If these lamps are turned on for 10 hours every day, their energy consumption in 20 days is:

(a) 1 kWh

(b) 10 kWh

(c) 5 kWh

(d) 50 kWh 11. In the presence of internal resistance of the source. Which one of the following relations between potential difference (V) and e.m.f (E) is correct? (when source is giving current to external resistance)

(a) E = 0

(b) E>V

(c) E = V

(d) E < V

12. Four equal resistors when connected in series dissipate 5 W power. If they are connected in parallel, the power dissipated will be:

(a) 20 W

(b) 60 W

(c) 40 W

13. A battery of emf 20 V and internal resistance r is connected across external resistance R. What is the observed potential difference across the terminals of the battery when external resistance R is made equal to internal resistance r:

(a) 20 V

(b) 15 V

(c) 10 V

14. An iron is rated at 550 W. How much would it cost to operate it for 2.5 hours at PKR 20/kWh?

(b) PKR 47.5

(c) PKR 37.5

(d) PKR 57.5

15. The source of e.m.f transfers its maximum power to the external circuit when (r=internal resistance, R= load resistance):

(a) r = 0

(b) r < R

16. A 200 W bulb B₁, a 150 bulb B₂ and a 75 W bulb B₃ are connected in series across a 240 V source. Now P1, P2 and P3 are the output powers of bulbs B1, B2 and B3 respectively, then:

(b)  $P_1 < P_2 = P =$ 

(c) P₁>P₂>P₃

|----|----------|-----|-------|-----------------------------------|
| 17 | Pick out | the | wrong | statement:                        |

- (a) In a simple battery circuit, the point of lowest potential is the negative terminal of the battery
- (b) The resistance of an incandescent lamp is greater when the lamp is switched off
- An ordinary 100 W lamp has less resistance than a 60 W lamp.
- The heat developed in a uniform wire increase directly as the resistance of the wire used is
- 18. Two electric bulbs whose resistances are in the ratio of 1:3 are connected in series. The powers dissipated in them have the ratio: (c) 1:6 (d) 3:1
- (b) 1:3

- 19. The power rating of an electric motor which draws a current of 4.25 A, when operated at 200 V is nearly:
  - (a) 425 W
- (b) 750 W
- (c) 525 W
- (d) 850 W

- 20. In 1 minute, 1 kW electric fire uses 10 times as much energy as a: (a) 1 W LED
  - (b) 100 W bulb
- (c) 10 W LED
- (d) 1000 W bulb
- 21. Three 60 W bulbs are in parallel across the 110 V power line. If one bulb burns out:
  - (a) There will be heavy current in main line
    - (b) Rest of the two bulbs will stop glowing
    - (c) Rest of the two bulbs will glow with initial brightness
    - (d) All bulbs will become short circuit
- 22. If the electromotive force of the battery is 5 V, the total energy supplied by the battery to unit coulomb charge is:
  - (a) 2.5 Joules
- (b) 1 Joule
- (c) 5 Joules
- (d) 10 Joules
- 23. The specific resistance of manganin is  $50 \times 10^{-8} \Omega$  m. What is the resistance of a cube of length 50cm will be:
  - (a) 10⁻⁶ Ω
- (b)  $2.5 \times 10^{-5} \Omega$
- (c) 10⁻⁸ Ω
- (d)  $5 \times 10^{-4} \Omega$
- 24. A piece of copper is to be shaped into a conductor of minimum resistance. The possible values of length and diameter are:
  - (a) I,d
- (b) 2l,d
- (c)  $\frac{1}{2}$ , 2d
- (d)  $2l, \frac{d}{2}$
- 25. What is the number of equal parts into which a conductor having a resistance Ro = 100 Q should be cut to obtain the resistance  $R = 1 \Omega$  if the parts are connected in parallel?
  - (a) 5

- (c) 20
- (d) 2

- 26. The example of non-ohmic resistance is:
  - (a) Copper wire

- (b) Carbon resistance (d) Tungsten wire
- (c) Silver wire 27. What is the unit of temperature coefficient?
  - (a) °C-1
- (b) Ω°C

(b) 10

- (c) °C
- (d) Ω°C
- 28. When  $2\Omega$ ,  $4\Omega$  and  $6\Omega$  resistances are connected in parallel, their resultant resistance will be:
  - (a) 12 Ω
- (b)  $\frac{11}{12}\Omega$
- Data is insufficient
- 29. Two electric bulbs rated as (p1, V) and (P2, V) are connected in series across V source. Then the total power dissipation by combination is:
  - (a) P1 + P2

- 30. If two electric bulbs have 40 W and 60 W rating at 220V, then the ratio of their resistance will be: (c) 3:4 (b) 2:3 (a) 3:2

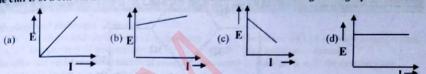

- 31. A hand drill draws 4 A and has a resistance 14.6 Ω. What power does it use? (d) 284 W (c) 134 W (b) 184 W (a) 234 W
  - 17. 18. 19. 20. 21. 22. 23. d c C a C

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

UNIT 07

32. The emf E of a cell varies with the current drawn from the cell according to the graph:

- 33. The resistance of a conductor increases with
  - (a) Increase in length

- (b) Increase in temperature
- (c) Decrease in cross-sectional area
- (d) All of these
- 34. The terminal potential difference of a cell is greater than its emf it is:
  - (a) Being discharged

(b) In open circuit

(c) Being charged

- (d) Either charge or discharge
- 35. The current in the adjoining circuit will be:

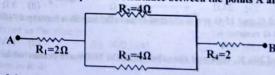

(b) 0.5 A

(c) 10 A

- 36. The electric bulb have tungsten filaments of same lengths. If one of them gives 60 watt and other 100 watt then,
  - (a) 100 watt bulb has thicker filament
  - (b) 60 watt bulb has thick filament
  - (c) Both filament are of same thickness (d) It is possible to get different wattage unless the lengths are different
- 37. Two identical heaters rated 220 volt, 1000 watt are placed in series with each other across 220 volt lines. If resistance do not change with temperature then the combined power is:
- (a) 1000 watt
- (b) 2000 watt
- (c) 500 watt
- (d) 400 watt
- 38. The equivalent resistance of resistors connected in series is always:
  - (a) Equal to the mean of component resistors
  - (b) Less than the lowest of component resistors
  - (c) In between the lowest and the highest of component resistors
  - (d) Equal to sum of component resistor
- 39. By increasing the temperature, the specific resistance of a conductor and a semiconductor is
  - (a) Increase for both

two adjacent vertices of square is:

- (b) Decrease for both
- (c) Increase, decrease (d) Decrease, increase 40. In the given figure, the equivalent resistance between the points A and B is:

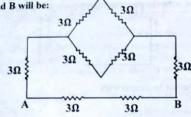

- (a) 8 Q
- (b) 6 Q
- (c) 4 Q 41. A wire has resistance 16  $\Omega$ . It is bend in form of a square. The effective resistance between any

(b) 6 Q (c) 9 Q (d) 12 Ω 41.

(a) 4Ω

42. Equivalent between A and B will be:

(b) 18 ohm

(c) 6 ohm

43. The resistance of a wire of uniform diameter d and length L is R. The resistance of another wire of the same material but diameter 2d and length 4L will be:

44. The length of the wire is doubled. Its conductance will be:

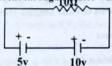

(a) Unchanged

(b) Halved

(c) Ouadrupled

of the original

45. In the diagram shown, the current through resistor will be:

46. If R₁ and R₂ are respectively the filament resistance of a 400W bulb and 200W bulb, designed to operate on the same voltage, then:

(a)  $R = 2R_2$ 

(b)  $R_2 = 4R_1$ 

(c)  $R_2 = 2R_1$  (d)  $R_1 = 4R_2$ 

47. The resistance of a wire R is cut into four equal parts and these parts are connected side by side. The effective resistance becomes:

48. A wire has a resistance of 12 ohm. It is bent in the form of a circle. The effective resistance between the two points on any diameter of circle is:

(b) 24 Ω

(c) 6 \O

49. Three resistors of 5  $\Omega$ , 10  $\Omega$  and 15  $\Omega$  are connected in parallel across a battery of 10V. The potential drop across 10 Ω resistor is:

(b) 5 V

(c) 3 V

50. Two electric bulbs, one of 200 V, 40W and the other of 200V, 100W are connected in a house wiring circuit:

(a) They have equal currents through them

(b) The resistance of filaments in both the bulbs is same

(c) The resistance of filament in 40W bulb is more than the resistance in 100W bulb

(d) The resistance of the filament in 100 W bulb is more than he resistance in 40W bulb

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

### PRACTICE TEST NO. 5

1 The electrical resistance of metals:

(a) Increases with an increase in temperature (b) Decreases with an increase in temperature

(c) Independent of temperature

(d) May increase or decrease

2. The effective resistance of n identical resistors connected in parallel is x. If the resistors are connected in series, the effective resistance becomes:

(c) n²x

3. Three resistances 4  $\Omega$  each are connected in the form of an equilateral triangle. The effective resistance between two corners is:

(a) 8 Q

(b) 12Ω

4. When a current flows through a conductor its temperature:

(a) May increase or decrease (c) Decrease

(b) Remains same

(d) Increase

5. Through a semiconductor, an electric current is due to drift of:

(a) Free electrons (b)

(c) Series or parallel with it

Free electrons and holes

Positive and

(d) protons

negative ions 6. Two wires A and B of same material and same length have radius r and 2r. If resistance of wire A is 32 Ω, then resistance of B will be:

(a) 8 Q

(b) 16 Ω

(c) 32 Q

(d) 128 Ω

7. A 60 watt bulb carries a current of 0.5 amp. The total charge passing through it in 1 hour is: (a) 3600 C (b) 3000 C (c) 2400 C (d) 1800 C

8. The brightness of a bulb will be reduced if a resistance is connected in: (a) Series with it

(b) Parallel with it (d) Brightness of bulb cannot be reduced

9. Two electric lamp of 40 watt each are connected in parallel. The power consumed by the combination will be:

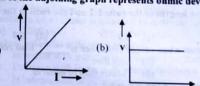

(a) 20 watt

(b) 80 watt

(c) 500 watt

(d) 100 watt

10. Which of the adjoining graph represents ohmic device.

11. The emf of battery is 6 V and internal resistance  $0.5~\Omega$ . It is connected to a wire of resistance  $2~\Omega$ The current in the wire is: (a) 3 A

(b) 0.33A

12. A cell of internal resistance 'r' is connected on an external resistance R. The current will be

(a) R=r

(b) R<r

13. The positive temperature coefficient of resistance is for: (a) Carbon

(b) Germanium

(c) Copper

(d) Silicon

| UNIT 07    |                       | CUF       | RENT ELECTR (a) 4.84 ohm

(b) 484 ohm

(c) 48.4 ohm

(d) 48440 ohm

26. Two electric bulb whose resistances are in the ratio of 1:4 are connected in parallel to a constant voltage source. The powers dissipated in them have the ratio:

(a) 1:2

(b) 4:1

(d) 1:4 (c) 2:1 27. Three resistances  $2\Omega$ ,  $3\Omega$  and  $5\Omega$  are connected in parallel to a battery of 10 V and of negligible internal resistance. The potential drop across the  $3\Omega$  resistance will be:

(a) 2 V

(b) 3 V

(c) 5 V

(d) 10 V

CURRENT ELECTRICITY

| 28. A 220 V and 700 W | electric kettle and four 22 | 0 V and 100 W bulbs a    | re connected in parallel. On |
|-----------------------|-----------------------------|--------------------------|------------------------------|
| connecting this comb  | bination with 220 V electr  | ic supply. The total cur | rrent will be:               |
| (a) 55 A              | (b) 69A                     | (c) 50A                  | (d) 02A                      |

29. A cell of emf E has internal resistance r. It is connected across external resistance of value x. The notential difference across the terminals of cell is E/2, then:

(a) x = r

(b) x < r

(c) x>r

(d) x = 0

30. Two electric bulbs rated as (P1, V) and (P2, V) are connected in series across V(volts) source. Then the total power dissipation by combination is:

(a)  $P_1 + P_2$ 

UNIT 07

31. The unit of electromotive force is:

(a) Newton

(b) Watt

(c) Joule

32. The electrical energy consumed by a 100 W bulb in 10 hour is:

(a) 1000 kWh

(b) 10 kWh

(c) 100 kWh

33. Which of the following pair/pairs contain sources of emf only?

(a) Batteries and thermocouples (c) Solar cells and electric generator

(b) Batteries and transformers

(d) Both A and C

34. Two 100 W,220 V bulbs are first connected in series then in parallel. Power in each case

respectively will be:

(a) 200 W, 160 W (b) 50 W, 200 W (c) 50 W, 100 W (d) 100 W, 50 W 35. Of the two bulbs in a house, one glows brighter than the other. Which of the two has larger resistance?

(a) Bright bulb

(c) Both have same resistance

(b) Dim bulb

(d) Brightness does not depend on resistance

36. If the power rating of a vacuum cleaner is 550 W, the current it draws in a 220V electric circuit

(a) 1

(b) 2.5 A

(c) 1.5 A

(d) 3.7 A

37. Internal resistance of a battery is ..... ohm, if, E=10V, V₁=9V, I=1A

(b) 0.1

(d) None of these

(c) 0.01 relationship exists between current and voltage in terms of Ohm's law.

(a) Non linear

(b) Varying (c) Linear

(d) None of them

39. A resistance of 40 Ohms is attached to a circuit having current of 300 Amp, Find its voltage. (a) 12000 volts (b) 15000 volts (c) 20000 volts

40. Terminal potential difference of a cell

(a) Increases with increase in its internal resistance

(b) Decrease with increase in internal resistance

(c) Is independent of its internal resistance

(d) None of these

41. If the conductor resistance is 50 ohm and the current passing through it is 5A. What is the value of potential difference? (a) 150V

42. Ohm's law is true for

(b) 50V

(c) 250V

(d) 15V

(a) Metallic conductors at low temperature

(b) Metallic conductors at high temperature

For electrolytes, when current passes through them For diode when current flows

- 44. When the length of the conductor is doubled and the area of cross-section remain the same then its resistance:
  - (a) Remains the same (c) Will become half
- (b) Will be doubled (d) Will increase by four times
- 45. If 1 ampere current will flow in 5m conductor for 1 hour the charge flow will be
- (c) 1C (b) 18000C 46. A potential difference of 10V is applied across a conductor whose resistance is 2.5 ohm. What is the value of current flowing through it?
- (b) 2A (c) 6A (d) 10A 47. The specific resistance of a conductor increases with:
  - (a) Increase in temperature
  - (b) Increase in cross-sectional area
  - (c) Decrease in length
  - (d) Decrease in cross-sectional area
- 48. Req =  $R_1 + R_2 + R_3 + \dots + Rn$  is the combination in
- (a) Series
- (b) Parallel
- (c) Both a and b
- (d) None of these
- 49. Materials that have both metallic and non-metallic characteristics are called:
- (a) Semiconductor (b) Metal
- (c) Non metal
- (d) Organic compound

- 50. As compared to thin wires, thick wires have:
  - (a) More resistance (b) No resistance (c) Less resistance (d) Same resistance
- 51. The battery of a pocket calculator supplies 0.35A at a potential difference of 6 volts. What is the power of the calculator?
- (a) 9 Watt
- (b) 2.1 Watt
- (c) 4 Watt
- (d) 7 Watt
- 52. An immersion heater of 400 watts kept on for 5 hours will consume electrical power of:
- (a) 2KWh
- (b) 20 KWh
- (c) 6KWh
- (d) 12KWh

- 53. The graphical representation fo Ohm's law is:
  - (a) Hyperbola
- (b) Ellipse
- (c) Parabola
- (d) Straight line
- 54. The specific resistance of a rod of copper as compared to that of thin wire of copper is:
  - (a) Less

(b) More

- (c) Same
- (d) Depends upon the length and area of cross-section of the wire
- 55.  $1/\text{Req} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \dots + 1/R_n$  is the combination in
  - (a) Series
- (b) Parallel
- (c) Both of them
- (d) None of them

56. Three 6  $\Omega$  are connected as shown in the diagram.

What is the resistance between points 'A' and 'B'?

(a) 6Ω

MMDCAT PREP BOOK

UNIT 07 57. Which combinations of seven identical resistors each of 2  $\Omega$  gives rise to the resultant of 10/11  $\Omega$ ?

CURRENT ELECTRICITY

(a) 5 parallel, 2 series

- (b) 3 parallel, 4 series
- (c) 4 parallel, 3 series (d) 2 parallel, 5 series
- 58. If a resistor having resistance 'R' is cut into three equal parts, then the equivalent of parallel combination is:

  - (a)  $\frac{6}{}$  (b)  $\frac{3}{}$

- 59. The resistance of a piece of wire is 12 Ω. It is bent to form an equilateral triangle. What is the equivalent resistance between any two corners of the triangles?
  - (a) 1.3 Ω
- (b) 4.0Ω
- (d) 2.7Ω
- 60. Total resistance between 'A' and 'B' in the given circuit is:

- (a) 5.6 Ω
- (b) 3.33 Ω
- (c) 0.33 Ω
- 61. Calculate the charge passing through the circuit if it's current is 10 Amp and the recorded time is 15 seconds:
  - (a) 1500 coulomb

(a) 250 seconds

(b) 150 coulomb

(b) 350 seconds

(c) 13400 coulomb

(c) 400 seconds

(c) Henry

(d) -140 coulomb (d) Watt

- 62. Coulomb per second is equivalent to:
  - (a) Ampere (b) Farad
- 63. Calculate the time taken for the charges to complete the circuit if the total charges were 5000 Coulomb and the current of the circuit was 20 Amp?
- (d) 500 seconds

- 64. Copper wire is used as connecting wire because:
  - (a) Copper has high electrical resistivity
  - (c) Copper has low electrical conductivity
- (b) Copper has low electrical resistivity (d) Copper has high value of elasticity
- 65. The fractional change in resistance per Kelvin is known as:
- - (a) Coefficient in resistance (c) Resistance
- (b) Temperature coefficient of resistance
- (d) None of these

If the radius of proton orbit is 10 cm (e) 2.0 cm (for magnetic field normally. If the radius of proton orbit is 10 cm (for magnetic field normally. If the radius of proton orbit is 10 cm (for magnetic field normally) (for magnetic force between magnetic field and velocity) then magnet | (c) The energy of the particle Lorentz force can be calculated by using the formula:  (a) $F = q(E + vxB)$ (b) $F = q(E - vxB)$ (c) $F = q(E + v,B)$ (d) An electron is moving on a circular path of radius r with speed v in a transverse $e^{t/m}$ for it will be:  (a) $\frac{v}{Br}$ (b) $\frac{B}{rv}$ (c) $\frac{vr}{B}$ (d) A charged particle enters a magnetic field B with its initial velocity making an a 3. The path of the particle will be:  (a) Straight line (b) Circle (c) Ellipse (d) A charge moving with velocity v in x-direction is subjected to a field of magnetic field with the charge will:  (a) Remain unaffected (b) Start moving in a circular (c) Retard along X-axis (d) Move along a helical path (a) Charge q is moving in a magnetic field then the magnetic force does not depend (a) Charge (b) Mass (c) Velocity (d) Charge to mass ratio of neutron is:  (a) $\frac{v}{Br}$ (b) $\frac{2v}{Br}$ (c) $\frac{2v}{B^2r^2}$ (d) The magnetic flux is maximum when angle between magnetic field and area is:  (a) $\frac{v}{Br}$ (b) $\frac{2v}{Br}$ (c) $\frac{2v}{B^2r^2}$ (d) A unit of magnetic induction is:  (a) $\frac{v}{Br}$ (b) $\frac{v}{Br}$ (c) $\frac{v}{Br^2}$ (d) A unit of magnetic induction is:  (a) $\frac{v}{Br}$ (b) $\frac{v}{Br}$ (c) $\frac{v}{Br^2}$ (d) A consider the electron is moving in a circle of radius r in a uniform magnetic field B. Sureduced to B/2. The radius of the circle now becomes:  (a) $\frac{v}{Br}$ (b) $\frac{v}{Br}$ (c) $\frac{v}{Br}$ (d) A consider the electron describes a circular orbit of radius 2 cm in a uniform magnetic field B. Sureduced to a circular orbit of radius 2 cm in a uniform magnetic field B. Sureduced to B/2. The radius of the circle now becomes:  (a) $\frac{v}{Br}$ (b) $\frac{v}{Br}$ (c) $\frac{v}{Br}$ (d) $\frac{v}{Br}$ (d) A relectron and an $\alpha$ -particle, accelerated through same potential difference, niform magnetic field normally. If the radius of proton orbit is 10 cm, then the robit is:  (a) $\frac{v}{Br}$ (b) $\frac{v}{Br}$ (c) $\frac{v}{Br}$ (d) $\frac{v}{Br}$ (e) $\frac{v}{Br}$ (d) $\frac{v}$ |

|       | miner is per            | rotates in a uniform magnetic field of 0.2 T. If | the loop rotate |
|-------|-------------------------|--------------------------------------------------|-----------------|
| piane | is normal to the field: |                                                  | with loop wife  |
| 12    |                         |                                                  |                 |

(a) 0.01 Wb (b) 0 Wb (c) 8.66x10⁻³ Wb (d) 0.86 Wb

2. If a charge of 2C is travelling parallel to a magnetic field of 4T with 20 m/s. Calculate the net

(a) 160 N (b) 120 N (c) 0 N (d) 100 N

3. A rectangular loop of dimension 3 cm by 5 cm is placed perpendicular in uniform magnetic field of 0.1 T, find the magnetic flux through the loop

(a) 1.5 wb (b) 0.015 wb (c) 0.15 wb (d) 0.00015 Wb

4. If a proton, alpha particle and photon moving with same velocity enter in uniform magnetic field then which particle will deflect more.

then which particle will deflect more

(a) Proton

(b) Alpha particle

(c) Photon

(d) All of these

5. A charge is moving with velocity v, it enters a uniform magnetic field B. The direction v is

perpendicular to B. What is the path of the charge particle inside the magnetic field?

(a) Parabolic (b) Circular (c) Parallel to v (d) Parallel to E

6. If a charge of 2C is moving with 5m/s enter at 30° in 3T, calculate the force experienced by it:

(a) 10N

(b) 15N

7. The unit of magnetic flux is:

(c) 20N (d) 30N

(c) Gauss

(a) Tesla (b) Weber

8. Ampere's law gives us the relationship between:

(a) Force and velocity of charge (b) Force and magnitude field

(c) Current and force (b) Force and magnitude field (d) Current and magnetic field

| THE RESERVE OF THE PARTY OF THE |                 |              |               |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    | -  |

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

(d) Henry

9. The diagram shows a small magnet hanging on a thread near the end of a solenoid carrying steady current I?

What happens to the magnet as the iron core is inserted into the solenoid?

- (a) It moves towards the solenoid
- It moves away from the solenoid
- It moves towards the solenoid and rotates through 180°
- (d) It moves away from the solenoid and rotates through 180°

10. For which value of " $\theta$ " between plane area of a coil and  $\vec{B}$ , flux reduces to  $\frac{\sqrt{3}}{2}$  times its maximum

- (a) 30°
- (c) 45°

11. A proton is moving with velocity  $\vec{v}$  in a direction opposite to the direction of magnetic field  $\vec{B}$ . The magnetic force experienced by the proton is:

- (a) Bev
- (b) -Bev
- (c) By
- (d) Zero

12. The magnetic force on a current carrying conductor of length L, carrying total no. of charges "nAL", each charge of value "q" is given as:

- (a)  $\vec{F} = q(\vec{v} \times \vec{B})$
- (b)  $\vec{F} = \text{gLA}(\vec{v} \times \vec{B})$  (c)  $\vec{F} = \text{gnAL}(\vec{v} \times \vec{B})$  (d)  $\vec{F} = \text{nAg}(\vec{v} \times \vec{B})$

13. The magnetic flux is minimum when angle between magnetic field and plane area is:

- (a) 0°
- (b) 30°
- (c) 60°

14. A particle moving in a magnetic field increase its velocity then its radius of the circle:

- (a) Decreases
- (b) Increases
- (c) Remains same (d) Becomes half

15. A proton, a deuteron and an α-particle, having the same kinetic energy, are moving in circular trajectories in a constant magnetic field. If  $r_p$ ,  $r_d$  and  $r_a$  denote, respectively the radii of the trajectories of these particles respectively, then:

- (a)  $r_{\alpha} = r_{p} < r_{d}$  (b)  $r_{\alpha} > r_{d} > r_{p}$
- (c)  $r_{\alpha} = r_{\rm d} > r_{\rm p}$  (d)  $r_{\rm p} = r_{\rm d} < r_{\rm o}$

16. What happens to the magnetic field produce by a solenoid if the number of turns of solenoid and its current are doubled, while its length is quadrupled?

(a) Becomes twice

(b) Becomes quadrupled

(c) Becomes 8 times

(d) Remains same

17. In particle velocity selector method, the selected speed v is given by

18. The force experienced by a charge particle is zero, when charge particle is projected at:

- (a)  $\theta = 0^\circ$
- (b)  $\theta = 90^{\circ}$
- (c)  $\theta = 45^{\circ}$
- (d)  $\theta = 120^{\circ}$

19. A long straight current carrying conductor has current direction from bottom to top when held vertically. What will be the direction of magnetic field lines when observed from top of the conductor?

(a) Clockwise

(b) Vertically upward

(c) Anticlockwise

(d) Vertically downward

20. A proton and α-particle enter a magnetic field normally. If the force experienced by the proton is double of that experienced by  $\alpha$ -particle, the ratio of their speeds is:

- (a) 0.5 (b) 2
- (c) 1

|      |    |     |     |     |     |     |     |     |     |     | THE PERSON NAMED IN COLUMN |

By AZHAR IQBAL 0336-7098894

21. Protons and α-particles of equal momenta enter a uniform magnetic field normally. The radii of

(c) 0.5

(d) 4

22. One Wb m-2 is equal to:

(a) 1

their orbits will have the ratio:

UNIT 08

- (a)  $10^4$  gauss
- (b) 2 (b) 10⁻² gauss
  - (c) 10² gauss
- (d) 10⁻² 23. A proton is moving with 2x107 ms parallel to a uniform magnetic field of 2.5 T. The magnetic force on the proton is:

(a)  $2.5 \times 10^{-10} \text{ N}$ (b) 8x10-12 N

(c) 8x10-11 N

(d) Zero

24. If an electron is placed in a uniform magnetic field as shown in the figure. Then the direction of force acting on it is:

- (a) Upward
- (b) Downward
- (c) Out of the paper
- 25. A charge of 1C is moving in a magnetic field 0.5 T with a velocity of 10 m/s perpendicular to the field. Force experienced is:

(a) 5 N

(a) East

- (b) 10 N
- (c) 0.5 N
- (d) 0 N
- 26. A moving charge will gain energy due to the application of: (a) Electric field
  - (b) Magnetic field (c) Both of these
- 27. An electron is moving in the north direction. It experiences a force in vertically upward direction.
  - The magnetic field at the position of the electron is in the direction of: (b) West
- (c) North 28. A proton moving with velocity v is acted upon by electric field E and magnetic field B. the proton will move undeflected if:
  - (a) E is perpendicular to B

- (b) E is parallel to v and perpendicular to B
- E, B and v are mutually perpendicular and (d) E and B both are parallel to v
- 29. A strong magnetic field is applied on a stationary electron, then:
  - (a) Electron moves in the direction of field (c) Electron remains stationary
    - (b) Electron moves in opposite direction

- (d) Electron starts spinning
- 30. The current is flowing in south direction along a power line. The direction of magnetic field above the power line is: (a) South (b) East (c) North
- 31. A bar magnet is moved at a steady speed of 2 ms-1 towards a coil of wire which is connected to a galvanometer. The magnet is now withdrawn along the same path at 4 m/s. The deflection of the
  - (a) Same direction as previously, with the magnitude of deflection doubled
  - Opposite direction as previously, with the magnitude of deflection halved
  - Same direction as previously, with the magnitude if deflection halved Opposite direction as previously, with the magnitude of deflection doubled

| Sr. 21.     | 22. | 23                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The state of | -   | 1   |     |     |                     |     |     |
